

# NAG Library Routine Document

## C02ANF

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

### 1 Purpose

C02ANF determines the roots of a quartic equation with complex coefficients.

### 2 Specification

```
SUBROUTINE C02ANF(E, A, B, C, D, ZEROR, ZEROI, ERREST, IFAIL)
INTEGER          IFAIL
double precision ZEROR(4), ZEROI(4), ERREST(4)
complex*16      E, A, B, C, D
```

### 3 Description

C02ANF attempts to find the roots of the quartic equation

$$ez^4 + az^3 + bz^2 + cz + d = 0,$$

where  $e$ ,  $a$ ,  $b$ ,  $c$  and  $d$  are complex coefficients with  $e \neq 0$ . The roots are located by finding the eigenvalues of the associated 4 by 4 (upper Hessenberg) companion matrix  $H$  given by

$$H = \begin{pmatrix} 0 & 0 & 0 & -d/e \\ 1 & 0 & 0 & -c/e \\ 0 & 1 & 0 & -b/e \\ 0 & 0 & 1 & -a/e \end{pmatrix}.$$

The eigenvalues are obtained by a call to F08PSF (ZHSEQR). Further details can be found in Section 8. To obtain the roots of a cubic equation, C02AMF can be used.

### 5 Parameters

- |    |  |              |
|----|--|--------------|
| 1: | E – <b>complex*16</b><br><i>On entry:</i> $e$ , the coefficient of $z^4$ .<br><i>Constraint:</i> $E \neq (0.0, 0.0)$ . | <i>Input</i> |
| 2: | A – <b>complex*16</b><br><i>On entry:</i> $a$ , the coefficient of $z^3$ .   | <i>Input</i> |
| 3: | B – <b>complex*16</b><br><i>On entry:</i> $b$ , the coefficient of $z^2$ .   | <i>Input</i> |
| 4: | C – <b>complex*16</b><br><i>On entry:</i> $c$ , the coefficient of $z$ .   | <i>Input</i> |

- 5: D – *complex\*16* *Input*  
*On entry:*  $d$ , the constant coefficient.
- 6: ZEROR(4) – *double precision* array *Output*  
7: ZEROI(4) – *double precision* array *Output*  
*On exit:* ZEROR( $i$ ) and ZEROI( $i$ ) contain the real and imaginary parts, respectively, of the  $i$ th root.
- 8: ERREST(4) – *double precision* array *Output*  
*On exit:* ERREST( $i$ ) contains an approximate error estimate for the  $i$ th root.
- 9: IFAIL – INTEGER *Input/Output*  
*On entry:* IFAIL must be set to 0,  $-1$  or 1. If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.  
*On exit:* IFAIL = 0 unless the routine detects an error (see Section 6).  
For environments where it might be inappropriate to halt program execution when an error is detected, the value  $-1$  or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0. **When the value  $-1$  or 1 is used it is essential to test the value of IFAIL on exit.**

## 6 Error Indicators and Warnings

If on entry IFAIL = 0 or  $-1$ , explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry,  $E = (0.0, 0.0)$ .

IFAIL = 2

The companion matrix  $H$  cannot be formed without overflow.

IFAIL = 3

The iterative procedure used to determine the eigenvalues has failed to converge.

## 7 Accuracy

If IFAIL = 0 on exit, then the  $i$ th computed root should have approximately  $|\log_{10}(\text{ERREST}(i))|$  correct significant digits.

## 8 Further Comments

The method used by the routine consists of the following steps, which are performed by routines from LAPACK in Chapter F08.

- (a) Form matrix  $H$ .
- (b) Apply a diagonal similarity transformation to  $H$  (to give  $H'$ ).
- (c) Calculate the eigenvalues and Schur factorization of  $H'$ .
- (d) Calculate the left and right eigenvectors of  $H'$ .
- (e) Estimate reciprocal condition numbers for all the eigenvalues of  $H'$ .
- (f) Calculate approximate error estimates for all the eigenvalues of  $H'$  (using the 1-norm).

## 9 Example

This example finds the roots of the quartic equation

$$z^4 + 16iz^2 - (8 - 8i)z - 65 = 0.$$
