

NAG Library Routine Document

F11MFF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F11MFF solves a real sparse system of linear equations with multiple right-hand sides given an LU factorization of the sparse matrix computed by F11MEF.

2 Specification

```
SUBROUTINE F11MFF (TRANS, N, IPRM, IL, LVAL, IU, UVAL, NRHS, B, LDB, IFAIL)
INTEGER          N, IPRM(7*N), IL(*), IU(*), NRHS, LDB, IFAIL
REAL (KIND=nag_wp) LVAL(*), UVAL(*), B(LDB,*)
CHARACTER(1)     TRANS
```

3 Description

F11MFF solves a real system of linear equations with multiple right-hand sides $AX = B$ or $A^T X = B$, according to the value of the parameter TRANS, where the matrix factorization $P_r A P_c = LU$ corresponds to an LU decomposition of a sparse matrix stored in compressed column (Harwell–Boeing) format, as computed by F11MEF.

In the above decomposition L is a lower triangular sparse matrix with unit diagonal elements and U is an upper triangular sparse matrix; P_r and P_c are permutation matrices.

4 References

None.

5 Parameters

- 1: TRANS – CHARACTER(1) *Input*
On entry: specifies whether $AX = B$ or $A^T X = B$ is solved.
 TRANS = 'N'
 $AX = B$ is solved.
 TRANS = 'T'
 $A^T X = B$ is solved.
Constraint: TRANS = 'N' or 'T'.
- 2: N – INTEGER *Input*
On entry: n , the order of the matrix A .
Constraint: $N \geq 0$.
- 3: IPRM($7 \times N$) – INTEGER array *Input*
On entry: the column permutation which defines P_c , the row permutation which defines P_r , plus associated data structures as computed by F11MEF.

- 4: IL(*) – INTEGER array *Input*
Note: the dimension of the array IL must be at least as large as the dimension of the array of the same name in F11MEF.
On entry: records the sparsity pattern of matrix L as computed by F11MEF.
- 5: LVAL(*) – REAL (KIND=nag_wp) array *Input*
Note: the dimension of the array LVAL must be at least as large as the dimension of the array of the same name in F11MEF.
On entry: records the nonzero values of matrix L and some nonzero values of matrix U as computed by F11MEF.
- 6: IU(*) – INTEGER array *Input*
Note: the dimension of the array IU must be at least as large as the dimension of the array of the same name in F11MEF.
On entry: records the sparsity pattern of matrix U as computed by F11MEF.
- 7: UVAL(*) – REAL (KIND=nag_wp) array *Input*
Note: the dimension of the array UVAL must be at least as large as the dimension of the array of the same name in F11MEF.
On entry: records some nonzero values of matrix U as computed by F11MEF.
- 8: NRHS – INTEGER *Input*
On entry: *nrhs*, the number of right-hand sides in B .
Constraint: NRHS \geq 0.
- 9: B(LDB,*) – REAL (KIND=nag_wp) array *Input/Output*
Note: the second dimension of the array B must be at least max(1, NRHS).
On entry: the N by NRHS right-hand side matrix B .
On exit: the N by NRHS solution matrix X .
- 10: LDB – INTEGER *Input*
On entry: the first dimension of the array B as declared in the (sub)program from which F11MFF is called.
Constraint: LDB \geq max(1, N).
- 11: IFAIL – INTEGER *Input/Output*
On entry: IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.
For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**
On exit: IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

6 Error Indicators and Warnings

If on entry $IFAIL = 0$ or -1 , explanatory error messages are output on the current error message unit (as defined by $X04AAF$).

Errors or warnings detected by the routine:

$IFAIL = 1$

On entry, $TRANS \neq 'N'$ or $'T'$,
 or $N < 0$,
 or $NRHS < 0$,
 or $LDB < \max(1, N)$.

$IFAIL = 2$

Ill-defined row permutation in array $IPRM$. Internal checks have revealed that the $IPRM$ array is corrupted.

$IFAIL = 3$

Ill-defined column permutations in array $IPRM$. Internal checks have revealed that the $IPRM$ array is corrupted.

$IFAIL = 301$

Unable to allocate required internal workspace.

7 Accuracy

For each right-hand side vector b , the computed solution x is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(n)\epsilon|L|U|,$$

$c(n)$ is a modest linear function of n , and ϵ is the *machine precision*, when partial pivoting is used.

If \hat{x} is the true solution, then the computed solution x satisfies a forward error bound of the form

$$\frac{\|x - \hat{x}\|_{\infty}}{\|x\|_{\infty}} \leq c(n) \text{cond}(A, x)\epsilon$$

where $\text{cond}(A, x) = \| |A^{-1}| |A| |x| \|_{\infty} / \|x\|_{\infty} \leq \text{cond}(A) = \| |A^{-1}| |A| \|_{\infty} \leq \kappa_{\infty}(A)$. Note that $\text{cond}(A, x)$ can be much smaller than $\text{cond}(A)$, and $\text{cond}(A^T)$ can be much larger (or smaller) than $\text{cond}(A)$.

Forward and backward error bounds can be computed by calling $F11MHF$, and an estimate for $\kappa_{\infty}(A)$ can be obtained by calling $F11MGF$.

8 Further Comments

$F11MFF$ may be followed by a call to $F11MHF$ to refine the solution and return an error estimate.

9 Example

This example solves the system of equations $AX = B$, where

$$A = \begin{pmatrix} 2.00 & 1.00 & 0 & 0 & 0 \\ 0 & 0 & 1.00 & -1.00 & 0 \\ 4.00 & 0 & 1.00 & 0 & 1.00 \\ 0 & 0 & 0 & 1.00 & 2.00 \\ 0 & -2.00 & 0 & 0 & 3.00 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 1.56 & 3.12 \\ -0.25 & -0.50 \\ 3.60 & 7.20 \\ 1.33 & 2.66 \\ 0.52 & 1.04 \end{pmatrix}.$$

Here A is nonsymmetric and must first be factorized by $F11MEF$.
