NAG Library Routine Document

F01GAF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

1 Purpose

F01GAF computes the action of the matrix exponential e^{tA} , on the matrix B, where A is a real n by m matrix, B is a real n by m matrix and t is a real scalar.

2 Specification

```
SUBROUTINE FO1GAF (N, M, A, LDA, B, LDB, T, IFAIL)

INTEGER N, M, LDA, LDB, IFAIL

REAL (KIND=nag_wp) A(LDA,*), B(LDB,*), T
```

3 Description

 $e^{tA}B$ is computed using the algorithm described in Al–Mohy and Higham (2011) which uses a truncated Taylor series to compute the product $e^{tA}B$ without explicitly forming e^{tA} .

4 References

5 Parameters

1: N – INTEGER Input

On entry: n, the order of the matrix A.

Constraint: $N \ge 0$.

2: M – INTEGER Input

On entry: m, the number of columns of the matrix B.

Constraint: $M \ge 0$.

3: A(LDA, *) - REAL (KIND=nag wp) array

Input/Output

Note: the second dimension of the array A must be at least N.

On entry: the n by n matrix A.

On exit: A is overwritten during the computation.

4: LDA – INTEGER Input

On entry: the first dimension of the array A as declared in the (sub)program from which F01GAF is called.

Constraint: LDA \geq N.

Mark 25 F01GAF.1

F01GAF NAG Library Manual

5: B(LDB,*) - REAL (KIND=nag wp) array

Input/Output

Note: the second dimension of the array B must be at least M.

On entry: the n by m matrix B.

On exit: the n by m matrix $e^{tA}B$.

6: LDB – INTEGER

Input

On entry: the first dimension of the array B as declared in the (sub)program from which F01GAF is called.

Constraint: LDB \geq N.

7: T - REAL (KIND=nag wp)

Input

On entry: the scalar t.

8: IFAIL – INTEGER

Input/Output

On entry: IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0. When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.

On exit: IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

```
IFAIL = 2
```

 $e^{tA}B$ has been computed using an IEEE double precision Taylor series, although the arithmetic precision is higher than IEEE double precision.

```
IFAIL = -1
```

On entry, $N = \langle value \rangle$. Constraint: $N \ge 0$.

IFAIL = -2

On entry, $M = \langle value \rangle$. Constraint: M > 0.

IFAIL = -4

On entry, LDA = $\langle value \rangle$ and N = $\langle value \rangle$. Constraint: LDA \geq N.

IFAIL = -6

On entry, LDB = $\langle value \rangle$ and N = $\langle value \rangle$. Constraint: LDB \geq N.

F01GAF.2 Mark 25

IFAIL = -99

An unexpected error has been triggered by this routine. Please contact NAG.

See Section 3.8 in the Essential Introduction for further information.

IFAIL = -399

Your licence key may have expired or may not have been installed correctly.

See Section 3.7 in the Essential Introduction for further information.

IFAIL = -999

Dynamic memory allocation failed.

See Section 3.6 in the Essential Introduction for further information.

7 Accuracy

For a symmetric matrix A (for which $A^T = A$) the computed matrix $e^{tA}B$ is guaranteed to be close to the exact matrix, that is, the method is forward stable. No such guarantee can be given for non-symmetric matrices. See Section 4 of Al-Mohy and Higham (2011) for details and further discussion.

8 Parallelism and Performance

F01GAF is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

F01GAF makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The matrix $e^{tA}B$ could be computed by explicitly forming e^{tA} using F01ECF and multiplying B by the result. However, experiments show that it is usually both more accurate and quicker to use F01GAF.

The cost of the algorithm is $O(n^2m)$. The precise cost depends on A since a combination of balancing, shifting and scaling is used prior to the Taylor series evaluation.

Approximately $n^2 + (2m + 8)n$ of real allocatable memory is required by F01GAF.

F01HAF can be used to compute $e^{tA}B$ for complex A, B, and t. F01GBF provides an implementation of the algorithm with a reverse communication interface, which returns control to the user when matrix multiplications are required. This should be used if A is large and sparse.

10 Example

This example computes $e^{tA}B$, where

$$A = \begin{pmatrix} 0.7 & -0.2 & 1.0 & 0.3 \\ 0.3 & 0.7 & 1.2 & 1.0 \\ 0.9 & 0.0 & 0.2 & 0.7 \\ 2.4 & 0.1 & 0.0 & 0.2 \end{pmatrix}$$

Mark 25 F01GAF.3

F01GAF NAG Library Manual

$$B = \begin{pmatrix} 0.1 & 1.2 \\ 1.3 & 0.2 \\ 0.0 & 1.0 \\ 0.4 & -0.9 \end{pmatrix}$$

and

t = 1.2.
