NAG Library Routine Document

G01EZF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

1 Purpose

G01EZF returns the probability associated with the upper tail of the Kolmogorov-Smirnov two sample distribution, via the routine name.

2 Specification

```
FUNCTION GO1EZF (N1, N2, D, IFAIL)
REAL (KIND=nag_wp) GO1EZF
INTEGER N1, N2, IFAIL
REAL (KIND=nag wp) D
```

3 Description

Let $F_{n_1}(x)$ and $G_{n_2}(x)$ denote the empirical cumulative distribution functions for the two samples, where n_1 and n_2 are the sizes of the first and second samples respectively.

The function G01EZF computes the upper tail probability for the Kolmogorov–Smirnov two sample two-sided test statistic D_{n_1,n_2} , where

$$D_{n_1,n_2} = \sup_x |F_{n_1}(x) - G_{n_2}(x)|.$$

The probability is computed exactly if $n_1, n_2 \le 10000$ and $\max(n_1, n_2) \le 2500$ using a method given by Kim and Jenrich (1973). For the case where $\min(n_1, n_2) \le 10\%$ of the $\max(n_1, n_2)$ and $\min(n_1, n_2) \le 80$ the Smirnov approximation is used. For all other cases the Kolmogorov approximation is used. These two approximations are discussed in Kim and Jenrich (1973).

5 Parameters

1: N1 – INTEGER Input

On entry: the number of observations in the first sample, n_1 .

Constraint: $N1 \ge 1$.

Mark 25 G01EZF.1

G01EZF NAG Library Manual

2: N2 – INTEGER Input

On entry: the number of observations in the second sample, n_2 .

Constraint: $N2 \ge 1$.

3: D - REAL (KIND=nag wp)

Input

On entry: the test statistic D_{n_1,n_2} , for the two sample Kolmogorov–Smirnov goodness-of-fit test, that is the maximum difference between the empirical cumulative distribution functions (CDFs) of the two samples.

Constraint: $0.0 \le D \le 1.0$.

4: IFAIL – INTEGER

Input/Output

On entry: IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0. When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.

On exit: IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, N1 < 1, or N2 < 1.

IFAIL = 2

On entry, D < 0.0, or D > 1.0.

IFAIL = 3

The approximation solution did not converge in 500 iterations. A tail probability of 1.0 is returned by G01EZF.

IFAIL = -99

An unexpected error has been triggered by this routine. Please contact NAG.

See Section 3.8 in the Essential Introduction for further information.

IFAIL = -399

Your licence key may have expired or may not have been installed correctly.

See Section 3.7 in the Essential Introduction for further information.

IFAIL = -999

Dynamic memory allocation failed.

See Section 3.6 in the Essential Introduction for further information.

G01EZF.2 Mark 25

7 Accuracy

The large sample distributions used as approximations to the exact distribution should have a relative error of less than 5% for most cases.

8 Parallelism and Performance

Not applicable.

9 Further Comments

The upper tail probability for the one-sided statistics, D_{n_1,n_2}^+ or D_{n_1,n_2}^- , can be approximated by halving the two-sided upper tail probability returned by G01EZF, that is p/2. This approximation to the upper tail probability for either D_{n_1,n_2}^+ or D_{n_1,n_2}^- is good for small probabilities, (e.g., $p \le 0.10$) but becomes poor for larger probabilities.

The time taken by the routine increases with n_1 and n_2 , until $n_1n_2 > 10000$ or $\max(n_1, n_2) \ge 2500$. At this point one of the approximations is used and the time decreases significantly. The time then increases again modestly with n_1 and n_2 .

10 Example

The following example reads in 10 different sample sizes and values for the test statistic D_{n_1,n_2} . The upper tail probability is computed and printed for each case.
