

## NAG Toolbox

### nag\_lapack\_zgerqf (f08cv)

## 1 Purpose

nag\_lapack\_zgerqf (f08cv) computes an RQ factorization of a complex  $m$  by  $n$  matrix  $A$ .

## 2 Syntax

```
[a, tau, info] = nag_lapack_zgerqf(a, 'm', m, 'n', n)
[a, tau, info] = f08cv(a, 'm', m, 'n', n)
```

## 3 Description

nag\_lapack\_zgerqf (f08cv) forms the  $RQ$  factorization of an arbitrary rectangular real  $m$  by  $n$  matrix. If  $m \leq n$ , the factorization is given by

$$A = (0 \quad R)Q,$$

where  $R$  is an  $m$  by  $m$  lower triangular matrix and  $Q$  is an  $n$  by  $n$  unitary matrix. If  $m > n$  the factorization is given by

$$A = RQ,$$

where  $R$  is an  $m$  by  $n$  upper trapezoidal matrix and  $Q$  is again an  $n$  by  $n$  unitary matrix. In the case where  $m < n$  the factorization can be expressed as

$$A = (0 \quad R) \begin{pmatrix} Q_1 \\ Q_2 \end{pmatrix} = RQ_2,$$

where  $Q_1$  consists of the first  $(n - m)$  rows of  $Q$  and  $Q_2$  the remaining  $m$  rows.

The matrix  $Q$  is not formed explicitly, but is represented as a product of  $\min(m, n)$  elementary reflectors (see the F08 Chapter Introduction for details). Functions are provided to work with  $Q$  in this representation (see Section 9).

## 5 Parameters

### 5.1 Compulsory Input Parameters

1:  $\mathbf{a}(lda, :)$  – COMPLEX (KIND=nag\_wp) array

The first dimension of the array  $\mathbf{a}$  must be at least  $\max(1, m)$ .

The second dimension of the array  $\mathbf{a}$  must be at least  $\max(1, n)$ .

The  $m$  by  $n$  matrix  $A$ .

## 5.2 Optional Input Parameters

1: **m** – INTEGER

*Default:* the first dimension of the array **a**.

$m$ , the number of rows of the matrix  $A$ .

*Constraint:*  $m \geq 0$ .

2: **n** – INTEGER

*Default:* the second dimension of the array **a**.

$n$ , the number of columns of the matrix  $A$ .

*Constraint:*  $n \geq 0$ .

## 5.3 Output Parameters

1: **a**(*lda*, :) – COMPLEX (KIND=nag\_wp) array

The first dimension of the array **a** will be max(1, **m**).

The second dimension of the array **a** will be max(1, **n**).

If  $m \leq n$ , the upper triangle of the subarray **a**(1 :  $m$ ,  $n - m + 1$  :  $n$ ) contains the  $m$  by  $m$  upper triangular matrix  $R$ .

If  $m \geq n$ , the elements on and above the  $(m - n)$ th subdiagonal contain the  $m$  by  $n$  upper trapezoidal matrix  $R$ ; the remaining elements, with the array **tau**, represent the unitary matrix  $Q$  as a product of  $\min(m, n)$  elementary reflectors (see Section 3.2.6 in the F08 Chapter Introduction).

2: **tau**(:) – COMPLEX (KIND=nag\_wp) array

The dimension of the array **tau** will be max(1, min(**m**, **n**))

The scalar factors of the elementary reflectors.

3: **info** – INTEGER

**info** = 0 unless the function detects an error (see Section 6).

## 6 Error Indicators and Warnings

**info** =  $-i$

If **info** =  $-i$ , parameter  $i$  had an illegal value on entry. The parameters are numbered as follows:

1: **m**, 2: **n**, 3: **a**, 4: **lda**, 5: **tau**, 6: **work**, 7: **lwork**, 8: **info**.

It is possible that **info** refers to a parameter that is omitted from the MATLAB interface. This usually indicates that an error in one of the other input parameters has caused an incorrect value to be inferred.

## 7 Accuracy

The computed factorization is the exact factorization of a nearby matrix  $A + E$ , where

$$\|E\|_2 = O\epsilon\|A\|_2$$

and  $\epsilon$  is the *machine precision*.

## 8 Further Comments

The total number of floating-point operations is approximately  $\frac{2}{3}m^2(3n - m)$  if  $m \leq n$ , or  $\frac{2}{3}n^2(3m - n)$  if  $m > n$ .

To form the unitary matrix  $Q$  nag\_lapack\_zgerqf (f08cv) may be followed by a call to nag\_lapack\_zungrq (f08cw):

```
[a, info] = f08cw(a, tau, 'k', min(m,n));
```

but note that the first dimension of the array **a** must be at least **n**, which may be larger than was required by nag\_lapack\_zgerqf (f08cv). When  $m \leq n$ , it is often only the first  $m$  rows of  $Q$  that are required and they may be formed by the call:

```
[a, info] = f08cw(a, tau);
```

To apply  $Q$  to an arbitrary real rectangular matrix  $C$ , nag\_lapack\_zgerqf (f08cv) may be followed by a call to nag\_lapack\_zunmrq (f08cx). For example:

```
[a, c, info] = f08cx('Left','C', a, tau, c);
```

forms  $C = Q^H C$ , where  $C$  is  $n$  by  $p$ .

The real analogue of this function is nag\_lapack\_dgerqf (f08ch).

## 9 Example

This example finds the minimum norm solution to the underdetermined equations

$$Ax = b$$

where

$$A = \begin{pmatrix} 0.28 - 0.36i & 0.50 - 0.86i & -0.77 - 0.48i & 1.58 + 0.66i \\ -0.50 - 1.10i & -1.21 + 0.76i & -0.32 - 0.24i & -0.27 - 1.15i \\ 0.36 - 0.51i & -0.07 + 1.33i & -0.75 + 0.47i & -0.08 + 1.01i \end{pmatrix}$$

and

$$b = \begin{pmatrix} -1.35 + 0.19i \\ 9.41 - 3.56i \\ -7.57 + 6.93i \end{pmatrix}.$$

The solution is obtained by first obtaining an  $RQ$  factorization of the matrix  $A$ .

Note that the block size (NB) of 64 assumed in this example is not realistic for such a small problem, but should be suitable for large problems.

### 9.1 Program Text

```
function f08cv_example

fprintf('f08cv example results\n\n');

% Minimum norm solution of AX = B, m<n
m = 3;
n = 4;
a = [ 0.28 - 0.36i, 0.50 - 0.86i, -0.77 - 0.48i, 1.58 + 0.66i;
      -0.50 - 1.10i, -1.21 + 0.76i, -0.32 - 0.24i, -0.27 - 1.15i;
      0.36 - 0.51i, -0.07 + 1.33i, -0.75 + 0.47i, -0.08 + 1.01i];
b = [ -1.35 + 0.19i;
      9.41 - 3.56i;
      -7.57 + 6.93i];

% Compute the RQ factorization of A
[rq, tau, info] = f08cv(a);

% RQX = B ==> C = QX = R^-1 B
c = zeros(n, 1);
```

```
il = n - m + 1;
[c(il:n,:), info] = f07ts( ...
    'Upper', 'No transpose','Non-Unit', rq(:,il:n), b);

% QX = C ==> X = Q^H C
[rq, x, info] = f08cx( ...
    'Left', 'Conjugate Transpose', rq, tau, c);

fprintf('Minimum-norm solution\n');
disp(x);
```

## 9.2 Program Results

f08cv example results

```
Minimum-norm solution
-2.8501 + 6.4683i
1.6264 - 0.7799i
6.9290 + 4.6481i
1.4048 + 3.2400i
```
