

NAG Toolbox

nag_blast_imax_val (f16dn)

1 Purpose

nag_blast_imax_val (f16dn) computes the largest component of an integer vector, along with the index of that component.

2 Syntax

```
[k, ii] = nag_blast_imax_val(n, x, incx)
[k, ii] = f16dn(n, x, incx)
```

3 Description

nag_blast_imax_val (f16dn) computes the largest component, i , of an n -element integer vector x , and determines the smallest index, k , such that

$$i = x_k = \max_j x_j.$$

5 Parameters

5.1 Compulsory Input Parameters

1: **n** – INTEGER

n , the number of elements in x .

2: **x(1 + (n - 1) × |incx|)** – INTEGER array

The n -element vector x .

If **incx** > 0, x_i must be stored in $\mathbf{x}((i - 1) \times |\mathbf{incx}| + 1)$, for $i = 1, 2, \dots, n$.

If **incx** < 0, x_i must be stored in $\mathbf{x}((\mathbf{n} - i) \times |\mathbf{incx}| + 1)$, for $i = 1, 2, \dots, n$.

Intermediate elements of \mathbf{x} are not referenced. If **n** = 0, \mathbf{x} is not referenced.

3: **incx** – INTEGER

The increment in the subscripts of \mathbf{x} between successive elements of x .

Constraint: **incx** ≠ 0.

5.2 Optional Input Parameters

None.

5.3 Output Parameters

1: **k** – INTEGER

k , the index, from the set $\{1, 2, \dots, n\}$, of the largest component of x . If $n \leq 0$ on input then **k** is returned as 0.

2: **ii** – INTEGER

i , the largest component of x . If $n \leq 0$ on input then **ii** is returned as 0.

6 Error Indicators and Warnings

If **incx** = 0, an error message is printed and program execution is terminated.

7 Accuracy

The BLAS standard requires accurate implementations which avoid unnecessary over/underflow (see Section 2.7 of Basic Linear Algebra Subprograms Technical (BLAST) Forum (2001)).

8 Further Comments

None.

9 Example

This example computes the largest component and index of that component for the vector

$$x = (1, 10, 11, -2, 9)^T.$$

9.1 Program Text

```
function f16dn_example

fprintf('f16dn example results\n\n');

% max integer and location
n      = nag_int(5);
x      = [nag_int(1) 10 11 -2 9];
incx  = nag_int(1);

[xloc, xmax] = f16dn(n, x, incx);

fprintf('max(');
fprintf('%4d',x);
fprintf(') = x(%4d) = %5d\n', xloc, xmax);
```

9.2 Program Results

```
f16dn example results

max( 1 10 11 -2 9) = x( 3) = 11
```
