

NAG Library Routine Document

D02NRF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

1 Purpose

D02NRF is an enquiry routine for communicating with D02NMF or D02NNF when supplying columns of a sparse Jacobian matrix.

2 Specification

```
SUBROUTINE D02NRF (J, IPLACE, INFORM)
INTEGER J, IPLACE, INFORM(23)
```

3 Description

D02NRF is required when D02NMF or D02NNF is being used with sparse matrix linear algebra. After an exit from D02NMF or D02NNF with IREVCM = 8, D02NRF must be called to determine which column of the Jacobian is required and where it is to be placed in the array RWORK (a parameter of D02NMF or D02NNF).

4 References

See the D02M–N sub-chapter Introduction.

5 Parameters

1: J – INTEGER	<i>Output</i>
	<i>On exit:</i> the index j of the column of the Jacobian which is required.
2: IPLACE – INTEGER	<i>Output</i>
	<i>On exit:</i> indicates which locations in the array RWORK to fill with the j th column. If $\text{IPLACE} = 1$, the (i, j) th element of the Jacobian must be placed in $\text{RWORK}(50 + 2 \times \text{LDYSAV} + i)$, otherwise the (i, j) th element must be placed in $\text{RWORK}(50 + \text{LDYSAV} + i)$. If $\text{JCEVAL} = \text{'F'}$, in the previous call to D02NUF, then $\text{IPLACE} = 2$ always, hence the j th column of the Jacobian must be placed in $\text{RWORK}(50 + \text{LDYSAV} + i)$, for $i = 1, 2, \dots, \text{NEQ}$.
	RWORK, NEQ and LDYSAV are parameters of D02NMF and D02NNF.
3: INFORM(23) – INTEGER array	<i>Communication Array</i>
	<i>On entry:</i> contains information supplied by the integrator.

6 Error Indicators and Warnings

None.

7 Accuracy

Not applicable.

8 Further Comments

None.

9 Example

See Section 9 in D02NNF.
