# NAG Library Routine Document F08XAF (DGGES)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

# 1 Purpose

F08XAF (DGGES) computes the generalized eigenvalues, the generalized real Schur form (S,T) and, optionally, the left and/or right generalized Schur vectors for a pair of n by n real nonsymmetric matrices (A,B).

# 2 Specification

```
SUBROUTINE FO8XAF (JOBVSL, JOBVSR, SORT, SELCTG, N, A, LDA, B, LDB, SDIM, ALPHAR, ALPHAI, BETA, VSL, LDVSL, VSR, LDVSR, WORK, LWORK, BWORK, INFO)

INTEGER

N, LDA, LDB, SDIM, LDVSL, LDVSR, LWORK, INFO

REAL (KIND=nag_wp) A(LDA,*), B(LDB,*), ALPHAR(N), ALPHAI(N), BETA(N), VSL(LDVSL,*), VSR(LDVSR,*), WORK(max(1,LWORK))

LOGICAL

CHARACTER(1) JOBVSL, JOBVSR, SORT

EXTERNAL

SELCTG
```

The routine may be called by its LAPACK name dgges.

# 3 Description

The generalized Schur factorization for a pair of real matrices (A, B) is given by

$$A = QSZ^{\mathsf{T}}, \qquad B = QTZ^{\mathsf{T}},$$

where Q and Z are orthogonal, T is upper triangular and S is upper quasi-triangular with 1 by 1 and 2 by 2 diagonal blocks. The generalized eigenvalues,  $\lambda$ , of (A,B) are computed from the diagonals of S and T and satisfy

$$Az = \lambda Bz$$

where z is the corresponding generalized eigenvector.  $\lambda$  is actually returned as the pair  $(\alpha, \beta)$  such that

$$\lambda = \alpha/\beta$$

since  $\beta$ , or even both  $\alpha$  and  $\beta$  can be zero. The columns of Q and Z are the left and right generalized Schur vectors of (A, B).

Optionally, F08XAF (DGGES) can order the generalized eigenvalues on the diagonals of (S,T) so that selected eigenvalues are at the top left. The leading columns of Q and Z then form an orthonormal basis for the corresponding eigenspaces, the deflating subspaces.

F08XAF (DGGES) computes T to have non-negative diagonal elements, and the 2 by 2 blocks of S correspond to complex conjugate pairs of generalized eigenvalues. The generalized Schur factorization, before reordering, is computed by the QZ algorithm.

### 5 Parameters

1: JOBVSL – CHARACTER(1)

Input

On entry: if JOBVSL = 'N', do not compute the left Schur vectors.

If JOBVSL = 'V', compute the left Schur vectors.

Constraint: JOBVSL = 'N' or 'V'.

2: JOBVSR - CHARACTER(1)

Input

On entry: if JOBVSR = 'N', do not compute the right Schur vectors.

If JOBVSR = 'V', compute the right Schur vectors.

Constraint: JOBVSR = 'N' or 'V'.

3: SORT – CHARACTER(1)

Input

On entry: specifies whether or not to order the eigenvalues on the diagonal of the generalized Schur form.

SORT = 'N'

Eigenvalues are not ordered.

SORT = 'S'

Eigenvalues are ordered (see SELCTG).

Constraint: SORT = 'N' or 'S'.

4: SELCTG – LOGICAL FUNCTION, supplied by the user.

External Procedure

If SORT = 'S', SELCTG is used to select generalized eigenvalues to the top left of the generalized Schur form.

If SORT = 'N', SELCTG is not referenced by F08XAF (DGGES), and may be called with the dummy function F08XAZ.

```
The specification of SELCTG is:
```

FUNCTION SELCTG (AR, AI, B)

LOGICAL SELCTG

REAL (KIND=nag\_wp) AR, AI, B

1: AR – REAL (KIND=nag wp)

Input Input

2: AI – REAL (KIND=nag\_wp)

Input

3:  $B - REAL (KIND=nag_wp)$ 

On entry: an eigenvalue  $(AR(j) + \sqrt{-1} \times AI(j))/B(j)$  is selected if SELCTG(AR(j), AI(j), B(j)) = .TRUE. If either one of a complex conjugate pair is selected, then both complex generalized eigenvalues are selected.

Note that in the ill-conditioned case, a selected complex generalized eigenvalue may no longer satisfy SELCTG(AR(j),AI(j),B(j)) = .TRUE. after ordering. INFO = N+2 in this case.

F08XAF.2 Mark 24

SELCTG must either be a module subprogram USEd by, or declared as EXTERNAL in, the (sub)program from which F08XAF (DGGES) is called. Parameters denoted as *Input* must **not** be changed by this procedure.

5: N – INTEGER Input

On entry: n, the order of the matrices A and B.

Constraint:  $N \ge 0$ .

6: A(LDA,\*) - REAL (KIND=nag\_wp) array

Input/Output

**Note**: the second dimension of the array A must be at least max(1, N).

On entry: the first of the pair of matrices, A.

On exit: A has been overwritten by its generalized Schur form S.

7: LDA – INTEGER Input

On entry: the first dimension of the array A as declared in the (sub)program from which F08XAF (DGGES) is called.

*Constraint*: LDA  $\geq \max(1, N)$ .

8: B(LDB,\*) - REAL (KIND=nag\_wp) array

Input/Output

**Note**: the second dimension of the array B must be at least max(1, N).

On entry: the second of the pair of matrices, B.

On exit: B has been overwritten by its generalized Schur form T.

9: LDB – INTEGER Input

On entry: the first dimension of the array B as declared in the (sub)program from which F08XAF (DGGES) is called.

Constraint: LDB  $\geq \max(1, N)$ .

10: SDIM – INTEGER

Output

On exit: if SORT = 'N', SDIM = 0.

If SORT = 'S', SDIM = number of eigenvalues (after sorting) for which SELCTG is .TRUE.. (Complex conjugate pairs for which SELCTG is .TRUE. for either eigenvalue count as 2.)

11: ALPHAR(N) – REAL (KIND=nag\_wp) array

Output

On exit: see the description of BETA.

12: ALPHAI(N) – REAL (KIND=nag wp) array

Output

On exit: see the description of BETA.

13: BETA(N) – REAL (KIND=nag wp) array

Output

On exit:  $(ALPHAR(j) + ALPHAI(j) \times i)/BETA(j)$ , for  $j = 1, 2, \dots, N$ , will be the generalized eigenvalues.  $ALPHAR(j) + ALPHAI(j) \times i$ , and BETA(j), for  $j = 1, 2, \dots, N$ , are the diagonals of the complex Schur form (S,T) that would result if the 2 by 2 diagonal blocks of the real Schur form of (A,B) were further reduced to triangular form using 2 by 2 complex unitary transformations.

If ALPHAI(j) is zero, then the *j*th eigenvalue is real; if positive, then the *j*th and (j+1)st eigenvalues are a complex conjugate pair, with ALPHAI(j+1) negative.

**Note:** the quotients ALPHAR(j)/BETA(j) and ALPHAI(j)/BETA(j) may easily overflow or underflow, and BETA(j) may even be zero. Thus, you should avoid naively computing the ratio

F08XAF NAG Library Manual

 $\alpha/\beta$ . However, ALPHAR and ALPHAI will always be less than and usually comparable with  $\|A\|_2$  in magnitude, and BETA will always be less than and usually comparable with  $\|B\|_2$ .

### 14: VSL(LDVSL,\*) - REAL (KIND=nag wp) array

Output

**Note**: the second dimension of the array VSL must be at least max(1, N) if JOBVSL = 'V', and at least 1 otherwise.

On exit: if JOBVSL = 'V', VSL will contain the left Schur vectors, Q.

If JOBVSL = 'N', VSL is not referenced.

#### 15: LDVSL – INTEGER

Input

On entry: the first dimension of the array VSL as declared in the (sub)program from which F08XAF (DGGES) is called.

Constraints:

```
if JOBVSL = 'V', LDVSL \ge max(1, N); otherwise LDVSL \ge 1.
```

## 16: VSR(LDVSR,\*) - REAL (KIND=nag\_wp) array

Output

**Note**: the second dimension of the array VSR must be at least max(1, N) if JOBVSR = 'V', and at least 1 otherwise.

On exit: if JOBVSR = 'V', VSR will contain the right Schur vectors, Z.

If JOBVSR = 'N', VSR is not referenced.

### 17: LDVSR - INTEGER

Input

On entry: the first dimension of the array VSR as declared in the (sub)program from which F08XAF (DGGES) is called.

Constraints:

```
if JOBVSR = 'V', LDVSR \ge max(1, N); otherwise LDVSR \ge 1.
```

# 18: WORK(max(1,LWORK)) – REAL (KIND=nag wp) array

Workspace

On exit: if INFO = 0, WORK(1) contains the minimum value of LWORK required for optimal performance.

### 19: LWORK – INTEGER

Input

On entry: the dimension of the array WORK as declared in the (sub)program from which F08XAF (DGGES) is called.

If LWORK =-1, a workspace query is assumed; the routine only calculates the optimal size of the WORK array, returns this value as the first entry of the WORK array, and no error message related to LWORK is issued.

Suggested value: for optimal performance, LWORK must generally be larger than the mimimum; add, say  $nb \times N$ , where nb is the optimal **block size**.

Constraints:

```
if N = 0, LWORK \geq 1; otherwise LWORK \geq max(8 \times N, 6 \times N + 16).
```

### 20: BWORK(\*) – LOGICAL array

Workspace

**Note**: the dimension of the array BWORK must be at least 1 if SORT = 'N', and at least max(1, N) otherwise.

If SORT = 'N', BWORK is not referenced.

F08XAF.4 Mark 24

21: INFO – INTEGER Output

On exit: INFO = 0 unless the routine detects an error (see Section 6).

# 6 Error Indicators and Warnings

Errors or warnings detected by the routine:

INFO < 0

If INFO = -i, argument i had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO = 1 to N

The QZ iteration failed. (A, B) are not in Schur form, but ALPHAR(j), ALPHAI(j), and BETA(j) should be correct for j = INFO + 1, ..., N.

INFO = N + 1

Unexpected error returned from F08XEF (DHGEQZ).

INFO = N + 2

After reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the generalized Schur form no longer satisfy SELCTG = .TRUE.. This could also be caused by underflow due to scaling.

INFO = N + 3

The eigenvalues could not be reordered because some eigenvalues were too close to separate (the problem is very ill-conditioned).

# 7 Accuracy

The computed generalized Schur factorization satisfies

$$A + E = QSZ^{\mathsf{T}}, \qquad B + F = QTZ^{\mathsf{T}},$$

where

$$||(E, F)||_F = O(\epsilon)||(A, B)||_F$$

and  $\epsilon$  is the *machine precision*. See Section 4.11 of Anderson *et al.* (1999) for further details.

# **8** Further Comments

The total number of floating point operations is proportional to  $n^3$ .

The complex analogue of this routine is F08XNF (ZGGES).

## 9 Example

This example finds the generalized Schur factorization of the matrix pair (A, B), where

$$A = \begin{pmatrix} 3.9 & 12.5 & -34.5 & -0.5 \\ 4.3 & 21.5 & -47.5 & 7.5 \\ 4.3 & 21.5 & -43.5 & 3.5 \\ 4.4 & 26.0 & -46.0 & 6.0 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 1.0 & 2.0 & -3.0 & 1.0 \\ 1.0 & 3.0 & -5.0 & 4.0 \\ 1.0 & 3.0 & -4.0 & 3.0 \\ 1.0 & 3.0 & -4.0 & 4.0 \end{pmatrix},$$

such that the real eigenvalues of (A,B) correspond to the top left diagonal elements of the generalized Schur form, (S,T).

F08XAF NAG Library Manual

Note that the block size (NB) of 64 assumed in this example is not realistic for such a small problem, but should be suitable for large problems.
