nag_complex_svd (f02xec)

1. Purpose

*nag_complex_svd* (f02xec) returns all, or part, of the singular value decomposition of a general complex matrix.

2. Specification

```c
#include <nag.h>
#include <nagf02.h>

void nag_complex_svd(Integer m, Integer n, Complex a[], Integer tda,
                      Integer ncolb, Complex b[], Integer tdb, Boolean wantq, Complex q[],
                      Integer tdq, double sv[], Boolean wantp, Complex ph[], Integer tdph,
                      Integer *iter, double e[], Integer *failinfo, NagError *fail)
```

3. Description

The $m$ by $n$ matrix $A$ is factorized as

$$A = QDP^H$$

where

- $D = \begin{pmatrix} S \\ 0 \end{pmatrix}$ if $m > n$
- $D = S$, if $m = n$
- $D = \begin{pmatrix} S \\ 0 \end{pmatrix}$ if $m < n$

$Q$ is an $m$ by $m$ unitary matrix, $P$ is an $n$ by $n$ unitary matrix and $S$ is a $\min(m,n) \times \min(m,n)$ diagonal matrix with real non-negative diagonal elements, $sv_1, sv_2, \ldots, sv_{\min(m,n)}$, ordered such that

$$sv_1 \geq sv_2 \geq \ldots \geq sv_{\min(m,n)} \geq 0.$$ 

The first $\min(m,n)$ columns of $Q$ are the left-hand singular vectors of $A$, the diagonal elements of $S$ are the singular values of $A$ and the first $\min(m,n)$ columns of $P$ are the right-hand singular vectors of $A$.

Either or both of the left-hand and right-hand singular vectors of $A$ may be requested and the matrix $C$ given by

$$C = Q^H B$$

where $B$ is an $m$ by $ncolb$ given matrix, may also be requested.

The function obtains the singular value decomposition by first reducing $A$ to upper triangular form by means of Householder transformations, from the left when $m \geq n$ and from the right when $m < n$. The upper triangular form is then reduced to bidiagonal form by Givens plane rotations and finally the $QR$ algorithm is used to obtain the singular value decomposition of the bidiagonal form.

Good background descriptions to the singular value decomposition are given in Dongarra *et al*(1979), Hammarling (1985) and Wilkinson (1978). Note that this function is not based on the LINPACK routine CSVDC.

Note that if $K$ is any unitary diagonal matrix such that

$$KK^H = I$$

then

$$A = (QK)D(PK)^H$$

is also a singular value decomposition of $A$. 

[NP3275/5/pdf] 3.f02xec.1
nag_complex_svd

4. Parameters

m
   Input: the number of rows, $m$, of the matrix $A$.
   Constraint: $m \geq 0$.
   When $m = 0$ then an immediate return is effected.

n
   Input: the number of columns, $n$, of the matrix $A$.
   Constraint: $n \geq 0$.
   When $n = 0$ then an immediate return is effected.

$a[m][tda]$
   Input: the leading $m$ by $n$ part of the array $a$ must contain the matrix $A$ whose singular value decomposition is required.
   Output: if $m \geq n$ and $\text{wantq} = \text{TRUE}$, then the leading $m$ by $n$ part of $a$ will contain the first $n$ columns of the unitary matrix $Q$.
   If $m < n$ and $\text{wantp} = \text{TRUE}$, then the leading $m$ by $n$ part of $a$ will contain the first $m$ rows of the unitary matrix $P^H$.
   If $m \geq n$ and $\text{wantq} = \text{FALSE}$ and $\text{wantp} = \text{TRUE}$, then the leading $n$ by $n$ part of $a$ will contain the first $n$ rows of the unitary matrix $P^H$.
   Otherwise the contents of the leading $m$ by $n$ part of $a$ are indeterminate.

ten
   Input: the second dimension of the array $a$ as declared in the function from which nag_complex_svd is called.
   Constraint: $tten \geq n$.

ncolb
   Input: $ncolb$, the number of columns of the matrix $B$. When $ncolb = 0$ the array $b$ is not referenced.
   Constraint: $ncolb \geq 0$.

$b[m][tdb]$
   Input: if $ncolb > 0$, the leading $m$ by $ncolb$ part of the array $b$ must contain the matrix to be transformed. If $ncolb = 0$ the array $b$ is not referenced and may be set to the null pointer, i.e., $(\text{Complex } *)0$.
   Output: $b$ is overwritten by the $m$ by $ncolb$ matrix $Q^H B$.

ten
   Input: the second dimension of the array $b$ as declared in the function from which nag_complex_svd is called.
   Constraint: if $ncolb > 0$ then $tten \geq ncolb$.

wantq
   Input: $\text{wantq}$ must be $\text{TRUE}$ if the left-hand singular vectors are required. If $\text{wantq} = \text{FALSE}$ then the array $q$ is not referenced.

$q[m][tdq]$
   Output: if $m < n$ and $\text{wantq} = \text{TRUE}$, the leading $m$ by $m$ part of the array $q$ will contain the unitary matrix $Q$. Otherwise the array $q$ is not referenced and may be set to the null pointer, i.e., $(\text{Complex } *)0$.

ten
   Input: the second dimension of the array $q$ as declared in the function from which nag_complex_svd is called.
   Constraint: if $m < n$ and $\text{wantq} = \text{TRUE}$, $tdq \geq m$.

sv[\min(m,n)]
   Output: the $\min(m,n)$ diagonal elements of the matrix $S$.

wantp
   Input: $\text{wantp}$ must be $\text{TRUE}$ if the right-hand singular vectors are required. If $\text{wantp} = \text{FALSE}$ then the array $ph$ is not referenced.
5. Error Indications and Warnings

NE_INT_ARG_LT
On entry, \( m \) must not be less than 0: \( m = \langle \text{value} \rangle \).
On entry, \( n \) must not be less than 0: \( n = \langle \text{value} \rangle \).
On entry, \( ncolb \) must not be less than 0: \( ncolb = \langle \text{value} \rangle \).

NE_2_INT_ARG_LT
On entry, \( tda = \langle \text{value} \rangle \) while \( n = \langle \text{value} \rangle \). These parameters must satisfy \( tda \geq n \).
On entry, \( tdb = \langle \text{value} \rangle \) while \( ncolb = \langle \text{value} \rangle \). These parameters must satisfy \( tdb \geq ncolb \).

NE_TDQ_LT_M
On entry, \( tdq = \langle \text{value} \rangle \) while \( m = \langle \text{value} \rangle \). When \( wantq \) is TRUE and \( m < n \) then relationship \( tdq \geq m \) must be satisfied.

NE_TDP_LT_N
On entry, \( tdph = \langle \text{value} \rangle \) while \( n = \langle \text{value} \rangle \). When \( wantq \) and \( wantp \) are TRUE and \( m \geq n \) then relationship \( tdph \geq n \) must be satisfied.

NE_QR_NOT_CONV
The QR algorithm has failed to converge in \( \langle \text{value} \rangle \) iterations. Singular values \( 1, 2, \ldots, \text{failinfo} \) may not have been found correctly and the remaining singular values may not be the smallest. The matrix \( A \) will nevertheless have been factorized as \( A = QEP^H \), where the leading \( \min(m, n) \) by \( \min(m, n) \) part of \( E \) is a bidiagonal matrix with \( sv[0], sv[1], \ldots, sv[\min(m,n-1)] \) as the diagonal elements and \( e[0], e[1], \ldots, e[\min(m,n-2)] \) as the super-diagonal elements. This failure is not likely to occur.

NE_ALLOC_FAIL
Memory allocation failed.

6. Further Comments

6.1. Accuracy
The computed factors \( Q, D \) and \( P \) satisfy the relation
\[
QDP^H = A + E
\]
where \( \|E\| \leq c\epsilon\|A\| \), \( \epsilon \) being the machine precision, \( c \) is a modest function of \( m \) and \( n \) and \( \|\cdot\| \) denotes the spectral (two) norm. Note that \( \|A\| = sv_1 \).
6.2. References

7. See Also

None.

8. Example

For this function two examples are presented, in Sections 8.1 and 8.2. In the example programs distributed to sites, there is a single example program for nag_complex_svd, with a main program:

```c
/* nag_complex_svd(f02xec) Example Program
 * Copyright 1990 Numerical Algorithms Group.
 * Mark 1, 1990.
 */
#include <nag.h>
#include <stdio.h>
#include <nagf02.h>
#define COMPLEX(A) A.re, A.im
#define COMPLEX_CONJ(A) A.re, -A.im
#define EX1_MMAX 20
#define EX1_NMAX 10
#define EX2_MMAX 10
#define EX2_NMAX 20
static void ex1(), ex2();
main()
{
    Vprintf("f02xec Example Program Results\n");
    Vscanf("%*[\n"); /* Skip heading in data file */
    ex1();
    ex2();
    exit(EXIT_SUCCESS);
}
```

The code to solve the two example problems is given in the functions ex1 and ex2, in Sections 8.1.1 and 8.2.1 respectively.

8.1 Example 1

To find the singular value decomposition of the 5 by 3 matrix

\[
A = \begin{pmatrix}
0.5i & -0.5 + 1.5i & -1.0 + 1.0i \\
0.4 + 0.3i & 0.9 + 1.3i & 0.2 + 1.4i \\
0.4 & -0.4 + 0.4i & 1.8 \\
0.3 - 0.4i & 0.1 + 0.7i & 0.0 \\
-0.3i & 0.3 + 0.3i & 2.4i
\end{pmatrix}
\]
together with the vector $Q^H b$ for the vector

$$
\begin{pmatrix}
-0.55 + 1.05i\\
0.49 + 0.93i\\
0.56 - 0.16i\\
0.39 + 0.23i\\
1.13 + 0.83i
\end{pmatrix}
$$
