NAG Library Function Document

nag_dormqr (f08agc)

1 Purpose

nag_dormqr (f08agc) multiplies an arbitrary real matrix C by the real orthogonal matrix Q from a QR factorization computed by nag_dgeqrf (f08aec), nag_dgeqpf (f08bec) or nag_dgeqp3 (f08bfc).

2 Specification

```
#include <nag.h>
#include <nagf08.h>
```

```
void nag_dormqr (Nag_OrderType order, Nag_SideType side,
    Nag_TransType trans, Integer m, Integer n, Integer k, const double a[],
    Integer pda, const double tau[], double c[], Integer pdc,
    NagError *fail)
```

3 Description

nag_dormqr (f08agc) is intended to be used after a call to nag_dgeqrf (f08aec), nag_dgeqpf (f08bec) or nag_dgeqp3 (f08bfc) which perform a QR factorization of a real matrix A. The orthogonal matrix Q is represented as a product of elementary reflectors.

This function may be used to form one of the matrix products

 $QC, Q^{\mathrm{T}}C, CQ$ or CQ^{T} ,

overwriting the result on c (which may be any real rectangular matrix).

A common application of this function is in solving linear least squares problems, as described in the f08 Chapter Introduction and illustrated in Section 10 in nag_dgeqrf (f08aec).

5 Arguments

```
1: order – Nag_OrderType
```

On entry: the order argument specifies the two-dimensional storage scheme being used, i.e., rowmajor ordering or column-major ordering. C language defined storage is specified by $order = Nag_RowMajor$. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **side** – Nag_SideType

On entry: indicates how Q or Q^{T} is to be applied to C.

side = Nag_LeftSide

Q or Q^{T} is applied to C from the left.

side = Nag_RightSide

Q or Q^{T} is applied to C from the right.

Constraint: **side** = Nag_LeftSide or Nag_RightSide.

Input

Input

3:	trans – Nag_TransType	Innut
5.	On entry: indicates whether Q or Q^{T} is to be applied to C.	Input
	$trans = Nag_NoTrans$	
	Q is applied to C .	
	$trans = Nag_Trans$ $Q^{T} is applied to C.$	
	Constraint: trans = Nag_NoTrans or Nag_Trans.	
4:	m – Integer	Input
	On entry: m, the number of rows of the matrix C.	
	Constraint: $\mathbf{m} \ge 0$.	
5:	n – Integer	Input
	On entry: n, the number of columns of the matrix C.	
	Constraint: $\mathbf{n} \ge 0$.	
6:	k – Integer	Input
	On entry: k, the number of elementary reflectors whose product defines the matrix Q .	1
	Constraints:	
	if side = Nag_LeftSide, $\mathbf{m} \ge \mathbf{k} \ge 0$; if side = Nag_RightSide, $\mathbf{n} \ge \mathbf{k} \ge 0$.	
7:	$\mathbf{a}[dim]$ – const double	Input
	Note: the dimension, dim, of the array a must be at least	
	$max(1, pda \times k)$ when order = Nag_ColMajor; $max(1, m \times pda)$ when order = Nag_RowMajor and side = Nag_LeftSide; $max(1, n \times pda)$ when order = Nag_RowMajor and side = Nag_RightSide.	
	On entry: details of the vectors which define the elementary reflectors, as returned by nag_(f08aec), nag_dgeqpf (f08bec) or nag_dgeqp3 (f08bfc).	dgeqrf
8:	pda – Integer	Input
	<i>On entry</i> : the stride separating row or column elements (depending on the value of order) array a .	in the
	Constraints:	
	if order = Nag_ColMajor,	
	if side = Nag_LeftSide, pda $\geq \max(1, \mathbf{m})$; if side = Nag_RightSide, pda $\geq \max(1, \mathbf{n})$.; if order = Nag_RowMajor, pda $\geq \max(1, \mathbf{k})$.	
9:	tau[dim] - const double	Input
	Note: the dimension, <i>dim</i> , of the array tau must be at least $max(1, k)$.	-
	<i>On entry</i> : further details of the elementary reflectors, as returned by nag_dgeqrf (f0 nag_dgeqpf (f08bec) or nag_dgeqp3 (f08bfc).)8aec),

10: $\mathbf{c}[dim] - double$

Note: the dimension, dim, of the array c must be at least

 $\max(1, \mathbf{pdc} \times \mathbf{n})$ when $\mathbf{order} = \operatorname{Nag_ColMajor};$ $\max(1, \mathbf{m} \times \mathbf{pdc})$ when $\mathbf{order} = \operatorname{Nag_RowMajor}.$

The (i, j)th element of the matrix C is stored in

 $\mathbf{c}[(j-1) \times \mathbf{pdc} + i - 1]$ when $\mathbf{order} = \text{Nag-ColMajor};$ $\mathbf{c}[(i-1) \times \mathbf{pdc} + j - 1]$ when $\mathbf{order} = \text{Nag-RowMajor}.$

On entry: the m by n matrix C.

On exit: **c** is overwritten by QC or $Q^{T}C$ or CQ or CQ^{T} as specified by side and trans.

11: **pdc** – Integer

On entry: the stride separating row or column elements (depending on the value of **order**) in the array c.

Constraints:

if order = Nag_ColMajor, $pdc \ge max(1, m)$; if order = Nag_RowMajor, $pdc \ge max(1, n)$.

12: fail – NagError *

Input/Output

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed. See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_ENUM_INT_3

On entry, side = $\langle value \rangle$, $\mathbf{m} = \langle value \rangle$, $\mathbf{n} = \langle value \rangle$ and $\mathbf{k} = \langle value \rangle$. Constraint: if side = Nag_LeftSide, $\mathbf{m} \ge \mathbf{k} \ge 0$; if side = Nag_RightSide, $\mathbf{n} \ge \mathbf{k} \ge 0$.

On entry, side = $\langle value \rangle$, $\mathbf{m} = \langle value \rangle$, $\mathbf{n} = \langle value \rangle$ and $\mathbf{pda} = \langle value \rangle$. Constraint: if side = Nag_LeftSide, $\mathbf{pda} \ge \max(1, \mathbf{m})$; if side = Nag_RightSide, $\mathbf{pda} \ge \max(1, \mathbf{n})$.

NE_INT

On entry, $\mathbf{m} = \langle value \rangle$. Constraint: $\mathbf{m} \ge 0$. On entry, $\mathbf{n} = \langle value \rangle$. Constraint: $\mathbf{n} \ge 0$. On entry, $\mathbf{pda} = \langle value \rangle$.

Constraint: $\mathbf{pda} > 0$.

On entry, $\mathbf{pdc} = \langle value \rangle$. Constraint: $\mathbf{pdc} > 0$. Input

Input/Output

NE_INT_2

On entry, $\mathbf{pda} = \langle value \rangle$ and $\mathbf{k} = \langle value \rangle$. Constraint: $\mathbf{pda} \geq \max(1, \mathbf{k})$.

On entry, $\mathbf{pdc} = \langle value \rangle$ and $\mathbf{m} = \langle value \rangle$. Constraint: $\mathbf{pdc} \geq \max(1, \mathbf{m})$.

On entry, $\mathbf{pdc} = \langle value \rangle$ and $\mathbf{n} = \langle value \rangle$. Constraint: $\mathbf{pdc} \geq \max(1, \mathbf{n})$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG. See Section 3.6.6 in the Essential Introduction for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

7 Accuracy

The computed result differs from the exact result by a matrix E such that

$$||E||_2 = O(\epsilon) ||C||_2,$$

where ϵ is the *machine precision*.

8 Parallelism and Performance

nag_dormqr (f08agc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_dormqr (f08agc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is approximately 2nk(2m-k) if side = Nag_LeftSide and 2mk(2n-k) if side = Nag_RightSide.

The complex analogue of this function is nag_zunmqr (f08auc).

10 Example

See Section 10 in nag_dgeqrf (f08aec).
