# NAG Library Routine Document <br> <br> F08NSF (ZGEHRD) 

 <br> <br> F08NSF (ZGEHRD)}

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of bold italicised terms and other implementation-dependent details.

## 1 Purpose

F08NSF (ZGEHRD) reduces a complex general matrix to Hessenberg form.

## 2 Specification

```
SUBROUTINE FO8NSF (N, ILO, IHI, A, LDA, TAU, WORK, LWORK, INFO)
INTEGER N, ILO, IHI, LDA, LWORK, INFO
COMPLEX (KIND=nag_wp) A(LDA,*), TAU(*), WORK(max(1,LWORK))
```

The routine may be called by its LAPACK name zgehrd.

## 3 Description

F08NSF (ZGEHRD) reduces a complex general matrix $A$ to upper Hessenberg form $H$ by a unitary similarity transformation: $A=Q H Q^{\mathrm{H}} . H$ has real subdiagonal elements.
The matrix $Q$ is not formed explicitly, but is represented as a product of elementary reflectors (see the F08 Chapter Introduction for details). Routines are provided to work with $Q$ in this representation (see Section 9).

The routine can take advantage of a previous call to F08NVF (ZGEBAL), which may produce a matrix with the structure:

$$
\left(\begin{array}{ccc}
A_{11} & A_{12} & A_{13} \\
& A_{22} & A_{23} \\
& & A_{33}
\end{array}\right)
$$

where $A_{11}$ and $A_{33}$ are upper triangular. If so, only the central diagonal block $A_{22}$, in rows and columns $i_{\mathrm{lo}}$ to $i_{\mathrm{hi}}$, needs to be reduced to Hessenberg form (the blocks $A_{12}$ and $A_{23}$ will also be affected by the reduction). Therefore the values of $i_{\text {lo }}$ and $i_{\text {hi }}$ determined by F08NVF (ZGEBAL) can be supplied to the routine directly. If F08NVF (ZGEBAL) has not previously been called however, then $i_{\text {lo }}$ must be set to 1 and $i_{\text {hi }}$ to $n$.

## 4 References

## 5 Parameters

1: N - INTEGER Input
On entry: $n$, the order of the matrix $A$.
Constraint: $\mathrm{N} \geq 0$.
2: ILO - INTEGER Input
3: IHI - INTEGER Input
On entry: if $A$ has been output by F08NVF (ZGEBAL), then ILO and IHI must contain the values returned by that routine. Otherwise, ILO must be set to 1 and IHI to N.

Constraints:

$$
\begin{aligned}
& \text { if } \mathrm{N}>0,1 \leq \mathrm{ILO} \leq \mathrm{IHI} \leq \mathrm{N} \\
& \text { if } \mathrm{N}=0, \mathrm{ILO}=1 \text { and } \mathrm{IHI}=0
\end{aligned}
$$

4: $\mathrm{A}(\mathrm{LDA}, *)$ - COMPLEX (KIND=nag_wp) array
Input/Output
Note: the second dimension of the array A must be at least $\max (1, \mathrm{~N})$.
On entry: the $n$ by $n$ general matrix $A$.
On exit: A is overwritten by the upper Hessenberg matrix $H$ and details of the unitary matrix $Q$. The subdiagonal elements of $H$ are real.

5: LDA - INTEGER
Input
On entry: the first dimension of the array A as declared in the (sub)program from which F08NSF (ZGEHRD) is called.
Constraint: $\mathrm{LDA} \geq \max (1, \mathrm{~N})$.
6: $\quad \mathrm{TAU}(*)-\mathrm{COMPLEX}(\mathrm{KIND}=$ nag_wp) array
Output
Note: the dimension of the array TAU must be at least $\max (1, \mathrm{~N}-1)$.
On exit: further details of the unitary matrix $Q$.
7: $\quad \operatorname{WORK}(\max (1, \operatorname{LWORK}))$ - COMPLEX (KIND=nag_wp) array
Workspace
On exit: if INFO $=0$, the real part of WORK $(1)$ contains the minimum value of LWORK required for optimal performance.

8: LWORK - INTEGER
Input
On entry: the dimension of the array WORK as declared in the (sub)program from which F08NSF (ZGEHRD) is called.
If LWORK $=-1$, a workspace query is assumed; the routine only calculates the optimal size of the WORK array, returns this value as the first entry of the WORK array, and no error message related to LWORK is issued.
Suggested value: for optimal performance, LWORK $\geq \mathrm{N} \times n b$, where $n b$ is the optimal block size.
Constraint: LWORK $\geq \max (1, \mathrm{~N})$ or $\operatorname{LWORK}=-1$.
9: INFO - INTEGER
Output
On exit: $\mathrm{INFO}=0$ unless the routine detects an error (see Section 6).

## 6 Error Indicators and Warnings

INFO $<0$
If INFO $=-i$, argument $i$ had an illegal value. An explanatory message is output, and execution of the program is terminated.

## 7 Accuracy

The computed Hessenberg matrix $H$ is exactly similar to a nearby matrix $(A+E)$, where

$$
\|E\|_{2} \leq c(n) \epsilon\|A\|_{2}
$$

$c(n)$ is a modestly increasing function of $n$, and $\epsilon$ is the machine precision.
The elements of $H$ themselves may be sensitive to small perturbations in $A$ or to rounding errors in the computation, but this does not affect the stability of the eigenvalues, eigenvectors or Schur factorization.

## 8 Parallelism and Performance

F08NSF (ZGEHRD) is not threaded by NAG in any implementation.
F08NSF (ZGEHRD) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.
Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

The total number of real floating-point operations is approximately $\frac{8}{3} q^{2}(2 q+3 n)$, where $q=i_{\text {hi }}-i_{\text {lo }}$; if $i_{\text {lo }}=1$ and $i_{\text {hi }}=n$, the number is approximately $\frac{40}{3} n^{3}$.

To form the unitary matrix $Q$ F08NSF (ZGEHRD) may be followed by a call to F08NTF (ZUNGHR):

```
CALL ZUNGHR(N,ILO,IHI,A,LDA,TAU,WORK,LWORK,INFO)
```

To apply $Q$ to an $m$ by $n$ complex matrix $C$ F08NSF (ZGEHRD) may be followed by a call to F08NUF (ZUNMHR). For example,

```
CALL ZUNMHR('Left','No Transpose',M,N,ILO,IHI,A,LDA,TAU,C,LDC, &
    WORK,LWORK,INFO)
```

forms the matrix product $Q C$.
The real analogue of this routine is F08NEF (DGEHRD).

## 10 Example

This example computes the upper Hessenberg form of the matrix $A$, where

$$
A=\left(\begin{array}{rrrr}
-3.97-5.04 i & -4.11+3.70 i & -0.34+1.01 i & 1.29-0.86 i \\
0.34-1.50 i & 1.52-0.43 i & 1.88-5.38 i & 3.36+0.65 i \\
3.31-3.85 i & 2.50+3.45 i & 0.88-1.08 i & 0.64-1.48 i \\
-1.10+0.82 i & 1.81-1.59 i & 3.25+1.33 i & 1.57-3.44 i
\end{array}\right)
$$
