NAG Library Routine Document F07FDF (DPOTRF)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

1 Purpose

F07FDF (DPOTRF) computes the Cholesky factorization of a real symmetric positive definite matrix.

2 Specification

```
SUBROUTINE F07FDF (UPLO, N, A, LDA, INFO)

INTEGER N, LDA, INFO

REAL (KIND=nag_wp) A(LDA,*)

CHARACTER(1) UPLO
```

The routine may be called by its LAPACK name dpotrf.

3 Description

F07FDF (DPOTRF) forms the Cholesky factorization of a real symmetric positive definite matrix A either as $A = U^{T}U$ if UPLO = 'U' or $A = LL^{T}$ if UPLO = 'L', where U is an upper triangular matrix and L is lower triangular.

5 Arguments

1: UPLO - CHARACTER(1)

Input

On entry: specifies whether the upper or lower triangular part of A is stored and how A is to be factorized.

```
UPLO = 'U'
```

The upper triangular part of A is stored and A is factorized as $U^{T}U$, where U is upper triangular.

```
UPLO = 'L'
```

The lower triangular part of A is stored and A is factorized as LL^{T} , where L is lower triangular.

Constraint: UPLO = 'U' or 'L'.

2: N – INTEGER

Input

On entry: n, the order of the matrix A.

Constraint: $N \ge 0$.

Mark 26 F07FDF.1

F07FDF NAG Library Manual

3: $A(LDA,*) - REAL (KIND=nag_wp) array$

Input/Output

Note: the second dimension of the array A must be at least max(1, N).

On entry: the n by n symmetric positive definite matrix A.

If UPLO = 'U', the upper triangular part of A must be stored and the elements of the array below the diagonal are not referenced.

If UPLO = 'L', the lower triangular part of A must be stored and the elements of the array above the diagonal are not referenced.

On exit: the upper or lower triangle of A is overwritten by the Cholesky factor U or L as specified by UPLO.

4: LDA – INTEGER

Input

On entry: the first dimension of the array A as declared in the (sub)program from which F07FDF (DPOTRF) is called.

Constraint: LDA $\geq \max(1, N)$.

5: INFO – INTEGER

Output

On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

INFO < 0

If INFO = -i, argument i had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO > 0

The leading minor of order $\langle value \rangle$ is not positive definite and the factorization could not be completed. Hence A itself is not positive definite. This may indicate an error in forming the matrix A. To factorize a symmetric matrix which is not positive definite, call F07MDF (DSYTRF) instead.

7 Accuracy

If UPLO = 'U', the computed factor U is the exact factor of a perturbed matrix A + E, where

$$|E| \le c(n)\epsilon |U^{\mathsf{T}}||U|,$$

c(n) is a modest linear function of n, and ϵ is the **machine precision**. If UPLO = 'L', a similar statement holds for the computed factor L. It follows that $|e_{ij}| \le c(n)\epsilon \sqrt{a_{ii}a_{jj}}$.

8 Parallelism and Performance

F07FDF (DPOTRF) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

F07FDF (DPOTRF) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is approximately $\frac{1}{2}n^3$.

A call to F07FDF (DPOTRF) may be followed by calls to the routines:

F07FEF (DPOTRS) to solve AX = B;

F07FGF (DPOCON) to estimate the condition number of A;

F07FJF (DPOTRI) to compute the inverse of A.

The complex analogue of this routine is F07FRF (ZPOTRF).

10 Example

This example computes the Cholesky factorization of the matrix A, where

$$A = \begin{pmatrix} 4.16 & -3.12 & 0.56 & -0.10 \\ -3.12 & 5.03 & -0.83 & 1.18 \\ 0.56 & -0.83 & 0.76 & 0.34 \\ -0.10 & 1.18 & 0.34 & 1.18 \end{pmatrix}.$$
